I just installed this on my factory crank up RV batwing antenna today, I went from Barely getting one bar of xfinitywifi to getting dozens full bars I got the plastic one and it definitely feels like you have to be careful installing it is plastic I added a lot of Dielectric grease to every part during the install, on the CAT5 plug, on the waterproof gasket, and on the end connector on both ends from the antenna.. I got all 3 items recommended to buy together the power over ethernet adapter the tp-link 15 DBI antenna and the bullet m2hp Everything looked waterproof enough and then I put Dielectric grease on everything on top of it so we'll see how it holds up I'll keep you up-to-date. Images in this review. Then, for some reason it died. I ordered another from Amazon and it arrived quickly. Because I would use it some miles from my home, I wanted to option it and verify its readiness before taking it to where it would be installed. The default username and password are both ubnt. That's when the trouble started. So I returned the Bullet as "defective upon receipt" and my money was quickly refunded. Because this device appears to be nearly obsolete I am not getting another, and will go to "Plan-B". I've been a network wrangler for decades so using this was only a bit difficult vernacular issues. I'm using it in my travel trailer, mounted on the 'bat-wing' TV antenna mast with a 12db omni to reach out to more hotspots to 'feed' my WifiRanger with. It would be simpler perhaps with using the WifiRanger setup, but this saved me lots of money doing it myself. I've used these at work to bridge ethernet from point to point with great success, with both omni and Yagi antennas. Great weather resistance and reliability. I expected to pay a lot more than I did, so doubly pleased. There are some UTube videos explaining how to set up for camper use that will help you get that done if you choose. Worth your effort! I think this was an excellent item and it worked great for about 1 month. It was defective and now I am having to replace this item because it was full of water from the rain and it shorted out. This is an outside item. I called the manufacturer UbiQuit and they said this should not have happened. I missed the time to return this item and am very sad because I was selling them to our clients and now I can't get my money back and I have to replace it for my client. If it does not last more than a month then I don't think it is worth the money. I would like to talk to someone about returning it for a refund even though it is after the time frame to return it. Purchased this with a TP-Link 2. The overall range of the device is excellent, but the throughput does not produce as expected. The bullet M2 does want to get above Mbps of throughput. This is the case even when the device is direct connected to a network that has 50 Mbps throughput to the internet. Other AP devices connect and max out without difficulty. We are really using these to just try and get the range that they are able to obtain with an omni antenna. I would not recommend this unless you have no option for range. I installed the Bullet several months ago. I never had one before. I travel and use it on my van. It is easy install. But I hired an IT tech. Once I learned how to do it, it became plenty simple to connect anywhere I go. It just took me a bit to get used to line of sight connection. But even that

is easy enough now. First I want to say these work great. I have mine hooked up to an omni antenna and it does exactly what I need it to do. Like others have said, don't use these outside without proper weatherproofing as they will draw moisture and fail. I knocked 1 star off because starting with the 5. What I mean by this is if you need to be able to connect to a router with these settings you simply won't be able to without downgrading to at least 5. They don't make this easy as the firmware isn't easily find able on their website, I had to google it and luckily the version I found worked. It was as simple as upgrading the firmware to the lower version from the web interface. I purchased this unit to act as a wireless bridge. I have this directly connected to a Tupavco TP Panel Antenna and am getting a consistent 52 Mbps throughput using 2. I am very pleased with this performance and the fact that I didn't have to purchase a separate point-to-point bridge to make that distance. I am running a camera and gate control via this wireless link with all powered by 12v deep cycle battery charged by solar. Even though this unit is spec'd at 24v, it has no problem at least for me being powered via passive POE connected to the 12v battery. I'll probably pick up a couple more of these to add network connectivity for cameras at the back of my property as well. See all reviews. Top reviews from other countries. Learn more There are many ways to improve your laptop screen's readability in the sun, such as adjusting screen brightness, using a laptop hood, and sitting under an umbrella. Even wearing polarized sunglasses and a darker shirt can reduce sun glare. We'll show you which settings to change and how to optimize your environment, and we'll even give you a few tips on searching for the perfect outdoor-optimized laptop. It's time to make your outdoor computing experience less frustrating and more productive. Increase the brightness in the display settings. Enable High-Contrast mode. Boost contrast. Buy a laptop hood or sunscreen. Build a laptop hood from a box. Work in the shade. Wear a darker shirt. Buy an Outdoor-View laptop. Did this summary help you? Yes No. We've been helping billions of people around the world continue to learn, adapt, grow, and thrive for over a decade. By using our site, you agree to our cookie policy. Cookie Settings. Learn why people trust wikiHow. Download Article Explore this Article methods. Tips and Warnings. Related Articles. Article Summary. Method 1 of Hike up the luminosity brightness in the display settings. Higher luminosity usually means high power consumption screens need the most energy in a laptop. You may need to depend on a power outlet rather than a battery. Bring an extension cord or a backup battery pack. On a Macbook, increase brightness with F2 and decrease with F1. Depending on your system, you may need to hold down the Fn key as you press the buttons. Turn on High Contrast Mode. When Ease of Access Center appears in the search results, click it to open the accessibility options. Buy a laptop hood or sun-screen. These handy items will be more expensive than buying a little box, but they provide the added bonus of protecting your computer from the elements. Build your own laptop hood. These boxes also make great DIY

laptop hoodsâ€"simply slide your laptop inside with the open side facing you and use your laptop as normal. You can also try using a regular cardboard box. Method 2 of Either find a spot under a tree, or set up a large beach umbrella. Not only will this make your laptop screen easier to see, but it'll also keep your laptop from overheating especially if it's black. If you'd rather keep your body in the sun, keep only the laptop in the shade, and wear a hat with a brim to keep the sun from shining right in your eyes. Wear sunglasses. A pair of polarized sunglasses can do wonders for your vision in the sun. Plus, sunglasses make you look cool. When shopping for sunglasses, choose amber lenses to increase contrast and make details more clear. If given the option, upgrade to glasses that have anti-reflective coating on the front and back of the lens to effectively reduce sun glare. If you're wearing a white shirt, you'll see its reflection in the screen. Switching to a black shirt will reduce that glare more than you'd expect. Get under a sheet or towel. If you're in a pinch, try draping a piece of fabricâ€"if you don't have a sheet or towel, an article of clothing will doâ€"over both your head and the laptop. While not the most ideal situation, this will almost certainly improve screen visibility in the sun. Method 3 of Look for outdoor-optimized models. Those with a glossy-finish one might look nicer indoors, but they'll reflect the sun all too well if you take them outside. Matte-screen laptops are few and far between these days, but you may have luck finding a used or refurbished model. Find a glossy-screened laptop that works great in the sun. Now that glossy screens outnumber the matte, your options may appear limited. But not all screens are created equalâ€"even some glossy screens have design enhancements that make them perform well in the sun. Some laptops with outdoor-friendly screens also have other features beneficial for outdoor use, such as a thick chassis that protects your laptop if it drops. Some of these laptops are even waterproof. Search online for reviews of these models, or drop by your local computer store to ask for recommendations. Include your email address to get a message when this question is answered. Carry an extra fully-charged laptop battery, especially if you've increased the brightness on your computer. Many changes you make to screen settings can be intense on the battery. Helpful 1 Not Helpful 0. If the laptop feels hot to the touch, put it away until the weather cools down.
