Verago

A virago a woman who demonstrates exemplary and heroic qualities. Modern use of the word virago generally takes the disparaging sense. Thus virago joined pejoratives such as termagant ,[2] mannish , amazonian and shrew to describe women who acted aggressively or like men. The word virago has almost always had an association with cultural gender transgression. There are recorded instances of viragos such as Joan of Arc fighting battles, wearing men's clothing, or receiving the tonsure. Virtus once again linked to vir , the brave man abiding by society's highest values and ethics as opposed to homo , human being defined the traits of excellence for a man in ancient Rome and Greece , including valor and heroism, but also morality and physical strength. Women and non-elite or unheroic men slaves, servants, craftsmen, merchants were considered a lesser category, and believed to be less excellent in Roman morality. A woman, however, if exceptional enough could earn the title virago. Virago, then, was a title of respect and admiration. In Christianity , a nun or holy woman who had become equal in divinity to male monks through practiced celibacy , exemplary religious practice and devotion, and intact virginity , was considered to have surpassed the limitations of her femaleness and was called virago. Standard modern dictionaries define virago as either, in order of definition, 1 a "loud overbearing woman"; a "shrew". The Vulgate Bible, translated by Jerome and others in the 4th century C. In Genesis , Jerome uses the words Vir for man and Virago for "woman" attempting to reproduce a pun on "male" and "female" ish and ishah that existed in the Hebrew text. Dixitque Adam hoc nunc os ex ossibus meis et caro de carne mea haec vocabitur virago quoniam de viro sumpta est. From Wikipedia, the free encyclopedia. For other uses, see Virago disambiguation. Vertigo is a symptom of a range of conditions. It can happen when there is a problem with the inner ear, brain, or sensory nerve pathway. Dizziness, including vertigo, can happen at any age, but it is common in people aged 65 years or over. Vertigo can be temporary or long-term. It can occur during pregnancy or as a symptom of an ear infection. Vertigo is a sensation of spinning dizziness, as though the room or surrounding environment is spinning in circles around the person. Many people use the term to describe a fear of heights, but this is not correct. Vertigo can happen when a person looks down from a great height, but it usually refers to any temporary or ongoing spells of dizziness that occur due to problems in the inner ear or brain. A person with vertigo will feel as though their head or the space around them is moving or spinning. Various conditions can lead to vertigo, which usually involves either an imbalance in the inner ear or a problem with the central nervous system CNS. This disorder can happen when an infection causes inflammation of the inner ear labyrinth. Within this area is the vestibulocochlear nerve. Apart from dizziness with vertigo, a person with labyrinthitis may experience hearing loss , tinnitus, headaches, ear pain, and vision changes. Learn more about labyrinthitis. An infection causes vestibular neuritis , which is inflammation of the vestibular nerve. Vestibular neuritis causes vertigo that may accompany blurred vision, severe nausea, or a feeling of being off balance. This noncancerous skin growth develops in the middle ear, usually due to repeated infection. This disease causes a buildup of fluid in the inner

ear, which can lead to attacks of vertigo with ringing in the ears and hearing loss. It tends to be more common in people between the ages of 40 and 60 years. The exact cause is unclear, but it may stem from blood vessel constriction, a viral infection, or an autoimmune reaction. There may also be a genetic component that means that it runs in some families. The inner ear contains structures called the otolith organs, which contain fluid and particles of crystals of calcium carbonate. In BPPV, these crystals become dislodged and fall into the semicircular canals. There, each fallen crystal touches sensory hair cells within the cupula of the semicircular canals during movement. People typically experience periods of vertigo that last less than 60 seconds, but nausea and other symptoms may also occur. Learn more here about BPPV. Nausea and dizziness are common problems during pregnancy. Hormonal changes appear to play a role , as they affect the characteristics of the fluid in the body. A study surveyed 82 women during pregnancy. More than half of them reported experiencing dizziness during the first two trimesters, while one-third reported dizziness in the third trimester. Nausea is common throughout pregnancy, but it tends to reduce as the pregnancy progresses. Many women in the survey linked nausea with dizziness. Balance problems were also common, but these tended to worsen during the second and third trimesters. The authors suggested that during pregnancy, hormonal changes bring about alterations in the inner ear. They proposed that as time goes on, the woman gets used to the new balance in the ear, and the symptoms of nausea and dizziness improve. The worsening of balance problems could be due to the changes in body weight and posture that occur during pregnancy. In , scientists published research involving four case studies. The authors suggested that hormonal changes may lead to BPPV during pregnancy and that estrogen , specifically, may play a role. Drug treatment may be available for reducing nausea, dizziness, and other vertigo-related symptoms during pregnancy, but a woman should ask her doctor for advice. Some treatments may not be suitable to use at this time. Vertigo itself is not necessarily hereditary, but it is commonly a symptom of various conditions and syndromes. Some of these appear to involve specific genetic factors and may run in families. If a person has recurrent vertigo, it may have a hereditary or genetic component. Scientists have been looking into the genetic profile of various conditions that involve vertigo. Vestibular migraine can involve vertigo. Find out more about this condition here. Some types of vertigo resolve without treatment, but a person may need treatment for an underlying problem. A doctor may, for example, prescribe antibiotics for a bacterial infection or antiviral drugs for shingles. Medications are available that can relieve some symptoms. These drugs include antihistamines and anti-emetics to reduce motion sickness and nausea. Surgery may be necessary if other treatments are not effective. BPPV and acoustic neuroma are two conditions for which this may be appropriate. Antihistamines are available over the counter or to purchase online. These may include meclizine, glycopyrrolate, or lorazepam, which can help relieve dizziness due to this condition. Steps that can help reduce the effects of vertigo include :. These include :. There is not enough evidence to confirm that herbal remedies can relieve vertigo. However, a clinical trial is currently underway to investigate the effects of Gongjin-dan. A study found that 30 minutes of acupuncture helped reduce symptoms in 60 people who visited an emergency department with dizziness and vertigo. However, more research is necessary to confirm the effectiveness of this treatment method. People should ask their doctor before using any alternative treatments. They should also see a doctor if vertigo starts suddenly or gets worse, as they may need treatment for an underlying condition. Learn more here about home remedies for vertigo. The maneuver aims to move calcium carbonate particles from the semicircular canals back to the otolith organs of the vestibule, where they are less likely to cause symptoms in the inner ear. There are different types of vertigo, which vary in their cause. Peripheral vertigo usually results from problems in the inner ear. This process enables people to keep their balance when they stand up. Changes to this system can produce vertigo. BPPV and inflammation are common causes. Central vertigo relates to problems with the CNS. It usually stems from a problem in a part of the brain stem or cerebellum. Possible causes include vestibular migraine, demyelination, and tumors involving the affected CNS region or regions. A problem with the cervical spine can lead to vertigo. Learn more here. The doctor will try to find out what is causing the dizziness. They will carry out a physical examination, ask the person how their dizziness makes them feel, and take their medical history. Here are two examples :. If the person becomes unsteady on closing their eyes, this could be a sign of a CNS problem. If they rotate to one side, this may indicate a lesion in the inner ear labyrinth, which could cause peripheral vertigo. Depending on the results of these and other tests, the doctor may recommend a head CT or MRI scan to obtain more details. I am 64 years old, and I have recently started feeling dizzy and sick all of the time. I have had tests on my ears, but the doctors have not found anything. I am a gardener, but I am finding it hard to work or do my daily tasks. What could it be, and what can I do? The cause of your dizziness may take time to figure out. There

could be multiple contributing factors, such as aging, dehydration, environmental factors, or an underlying medical disorder. Keeping a journal may help you pinpoint certain times or situations during which you experience symptoms of dizziness. Journaling details about the surrounding environment, the type of dizziness â€" for example, whether the room spins, whether you feel off balance, etc. There are several possible causes for throat irritation, including allergies, strep throat, and the common cold.
