You usually need 10 shims. Best quality composite OEM Style cork gaskets we can get! We do NOT carry the super cheap ones that swell, crack, or don't fit when new! We prefer these square shaped tins over the "Super Cool Tins" that many people use. These also MUST be used in conjunction with "Sled Tins" to keep air rushing beneath the engine from "backing up" the cooling air's escape, out and back! You need TWO of these do to one engine. These are often missing, and this results in a significant temperature difference from cylinder upper and lower, and lessens cylinder lifespan because they distort and warp non round. If you remove too many, you'll wind up tightening the nut until the belt is "tight enough", but the 2 pulley halfs are not squeezed together, and as the engine rotates the pulleys wear one another out. Every rotation the outer pulley moves out at the top, then in at the bottom, out at the top, until they are ruined. By doing it the shim way, when you get the right tension the pulley halfs are tight against the shims and one another, and this movement and wear do not occur. They are used Extensively throughout the engine, securing the tin and backing plates in place. They replace the regular sheet metal screws which are 6 x 1 x 12mm which hold the VW Engine Tin in place. Generator and Alternator Stand Gasket, Between Stand and Case, 40hpcc Engines, is the paper gasket on either side of the deflector plate. Using a thin coating of Curil-T will prevent any chance of an oil leak from this location! You need two of these for each engine, one on either side of the deflector plate. The Phillips version was used on the Type 4 engine since it is much easier to install in hard-to-access places. But using them on the upgright engine has benefits too! Generator and Alternator Stand Oil Deflector Plate, Between Case and Stand, 40hpcc Engines, B is a vital component to preventing oil being blown from the crankcase to the air filter or breather box! Proper orientation is critical! You need one of these for each engine. You don't have to use a gasket on either side of this plate, if you use Curil-T instead a fantastic sealant. But tried and true paper gaskets also work great! Spark Plug Wire Seal Flapper Seal , All Models, Each, A keeps critical cooling air in the fan shroud where it cools your hot cylinders and heads, instead of blowing out the plug wire holes where it does not good at all! These are sold each, you need 4 to seal up one engine. It's a good idea to keep a spare nut around, if it comes off these are gone. Woodruff Key, Crankshaft Pulley On Nose of Crankshaft, is the "key" for the pulley to the engine's crankshaft. This prevents the pulley from spinning on the crank, and also indexes the pulley so you can set the ignition timing properly. Be sure to use a brass drift when installing and removing this key, so it doesn't get burred up and damage your crank or your pulley! You can change these with the generator on the car, use a length of thread to hook the spring and pull it back! It flexes to act as a spring, keeping constant pressure to prevent nut loosening. Grommet, Note that Type 1s need TWO 2 of these grommets! They also protect the hoses from getting torn on the tin where it goes through. We sell these in both a short and tall version. It is part of the assembly of hardware that holds the cooling fan in place. It is part of the assembly of hardware which holds the cooling fan in place, and sits between the fan and fan nut. These deflect air to the lower parts of the cylinders, to properly cool them. If these are omitted from the engine, the cooling air simply rushes down between the cylinders, and the bottoms of the

You can use both or one of the wavy washers to space your fan properly so it does not hit the fan shroud while spinning. This original VW grommet was used by the factory to prevent the sharp edge of the engine tin from cutting a hole in the heater hose where it passes through the rear apron tin. This causes precious cooling air to be wasted, as well as low Are the heater hoses from your fan shroud getting cut by the sharp engine tin as they pass through it to where they connect to the heater boxes?
